

On Thursday, the 10th of July 2025. I worked on the UI components of the brainwave landing page. I started by creating a reusable **Button** component that accepts `children` (text or elements inside the button) and a `type` prop. For now, I'm only using a `"primary"` type which gives the button a white text color and a primary background. This allows the same button style to be reused in multiple parts of the app.

Next, I built the **Navbar** component. I used an array to store the menu items and then used `.map()` to loop through the items. For the last item ("Get a free quote"), I kept it inside the Button component on the nav bar. I also styled the navbar to stick to the top of the page using `position: fixed`.

After that, I worked on the **Hero** section. I used Tailwind CSS classes for a pixel perfect design implementation.
